

Python Cookbook

This cookbook collects small recipes for everyday Python work.

Start by creating a virtualenv: `python -m venv .venv`

Activate it and install dependencies with `pip install -e .`

Pin exact versions in `requirements.txt` to keep builds reproducible.

Use `pyproject.toml` for modern projects instead of `setup.py`.

Web Recipes

Flask is a good fit for small internal services.

Expose routes with `@app.route` and return JSON with `jsonify`.

The `requests` library handles HTTP clients; always set a timeout.

Use a session object to reuse connection pools across calls.

Testing Recipes

Write unit tests with pytest and keep them deterministic.

Mock slow boundaries like network calls with pytest-mock.

A test should fail for exactly one reason; keep it focused.

Run the suite locally before opening a pull request.
